MAIN FEATURES

Note: The survey estimates are subject to sampling variability, as explained on pages 5-7. Standard errors are shown on page 6. See also the section entitled 'Revision and Comparability of Series' on page 5.

In August 1980 (August 1979 figures shown in brackets):

- * the estimated labour force participation rate was 60.6 (60.9) per cent for all persons aged 15 years and over; 77.4 (77.9) per cent for males, 44.4 (44.4) per cent for females and 42.8 (43.0) per cent for married women;
- * the estimated number employed was 550 400 (547 400) persons, comprising 348 500 males and 201 900 females, including 128 300 married women. Of this total 454 400 were employed full-time and 96 000 part-time;
- * the estimated number unemployed was 47 700 (45 300) persons or 8.0 (7.6) per cent of the labour force, comprising 26 800 males and 20 900 females, including 6 500 married women. The unemployment rate was 7.1 (6.4) per cent for males, 9.4 (9.7) per cent for females and 4.8 (5.9) per cent for married women;
- * the unemployment rate for persons aged 15-19 years was 22.0 (21.3) per cent for males and 24.5 (25.9) per cent for females.

EXPLANATORY NOTES

INTRODUCTION

These estimates are derived from the monthly population survey which is carried out on a sample basis throughout Australia.

The survey is based on a multi-stage area sample of private dwellings (currently about 4 900 houses, flats etc.) and non-private dwellings (hotels, motels etc.) and covers about one per cent of the population of South Australia. Information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers. The interviews are generally conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week before the interview (i.e. the survey week).

SCOPE

The survey includes all persons aged fifteen years and over, except:

- (i) members of the permanent defence forces and of non-Australian defence forces (and their dependents) stationed in Australia;
- (ii) certain diplomatic personnel of overseas governments, customarily excluded from census and population estimates, and
- (iii) overseas visitors holidaying in Australia.

DEFINITIONS

The labour force category to which a person is assigned depends on his actual activity (i.e. whether working, looking for work, etc.) during the survey week. The definitions conform closely to the international standard definitions recommended by the International Labour Organization and relate only to those persons within the scope of the survey.

Employed persons comprise all those aged 15 years and over who, during the survey week:

- (i) worked for one hour or more for pay, profit, commission or payment in kind, in a job or business, or on a farm (including employees, employers and self-employed persons); or
- (ii) worked for 15 hours or more without pay in a family business or on a farm (i.e. unpaid family helper); or
- (iii) were employees who had a job but were not at work and were: on paid leave; on leave without pay for less than four weeks up to the end of the survey week; stood down without pay because of bad weather or plant breakdown at their place of employment for less than four weeks up to the end of the survey week; on strike or locked out; on workers' compensation and expected to be returning to their job; or receiving wages or salary while undertaking full-time study; or
- (iv) were employers or self-employed persons who had a job, business or farm, but were not at work.

Unemployed persons are those aged 15 years and over who were not employed during the survey week, and:

- (i) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week; and
 - (a) were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or
 - (b) were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then; or
- (ii) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

Unemployment rate for any group is the number unemployed expressed as a percentage of the labour force (i.e. employed plus unemployed) in the same group.

The labour force comprises all persons who, during the survey week, were employed or unemployed, as defined above.

The labour force participation rate for any group is the labour force expressed as a percentage of the civilian population aged 15 years and over in the same group.

Full-time workers are those who usually work 35 hours a week or more and others who, although usually part-time workers, worked 35 hours or more during the survey week. Part-time workers are those who usually work less than 35 hours a week and who did so during the survey week. When recording hours of work, fractions of an hour are disregarded.

Average hours of work refer to actual hours worked during the survey week, not hours paid for. The figures may be affected by public holidays, leave, absenteeism; temporary absence from work due to sickness, injury, accident and industrial dispute; and stoppages of work due to bad weather, plant breakdown etc. When hours of work are recorded fractions of an hour are disregarded and this results in slightly lower figures than would be the case if actual time

worked was recorded. Persons stood down for the whole of the survey week without pay because of bad weather or plant breakdown at their place of employment are regarded as employed and therefore are included (working no hours) in the calculation of average hours worked. Persons stood down in the survey week for reasons other than bad weather and plant breakdown and waiting to be called back to their job are regarded as unemployed and are therefore excluded from the calculation.

Persons not in the labour force are those who, during the survey week, were not in the categories 'employed' or 'unemployed'. This category includes persons who were keeping house (unpaid), attending an educational institution (school, university etc.), retired, voluntarily inactive, permanently unable to work, inmates of institutions, trainee teachers, members of contemplative religious orders, and persons whose only activity during the survey week was jury service or unpaid voluntary work for a charitable organisation, provided they had not actively looked for work in the four weeks up to the end of the survey week, and:

(i) in the survey week;

(a) were without a job, business, or farm, or

(b) had worked for less than one hour for pay, profit, commission or payment in kind, or

(c) had worked for less than 15 hours without pay in a family business or on a farm, or

(ii) had been stood down without pay for four weeks or more up to the end of the survey week.

CLASSIFICATION OF INDUSTRY AND OCCUPATION

Industry is classified according to the Australian Standard Industrial Classification (ASIC), 1978 Edition and occupation according to the Classification and Classified List of Occupations, Revised June 1976.

REVISION AND COMPARABILITY OF SERIES

Revised estimates for the period August 1971 to November 1977 were published in the February 1979 issue of this publication which also contained information on the revisions and details of changes in the series.

Occasionally the estimates of month-to-month changes in numbers employed are difficult to reconcile with what is known of developments in industry, commerce or government employment. For this reason an investigation is being undertaken of methods and procedures used in producing the estimates.

The Australian Bureau of Statistics (ABS) also produces a series of employment statistics relating to civilian employees. The benchmarks for this series are derived from population censuses, labour force surveys, economic censuses and surveys and other special returns. Estimates for subsequent months are calculated using three main sources; (a) payroll tax returns; (b) returns from government bodies and (c) other returns of employment (eg hospitals); the balance (i.e. unrecorded private employment) is estimated. The estimates relate only to civilian employees, not the total labour force: excluded are employers, self-employed persons, unpaid helpers, the unemployed, employees in agriculture, and staff employed in private households and defence forces. This series also is being reviewed in respect of methods, procedures and reliability and publication is being delayed pending completion of that review.

RELIABILITY OF THE ESTIMATES

Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the surveys. One measure of the likely difference is given by the standard error, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included in the surveys. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

Another measure of sampling variability is the relative standard error which is obtained by expressing the standard error as a percentage of the estimate to which it refers. The relative standard error is a useful measure in that it provides an immediate indication of the percentage errors likely to have occurred due to sampling, and thus avoid the need to refer also to the size of the estimate.

Standard errors of estimates and of monthly movements are shown in the tables below. A guide to the standard errors of quarterly movements can be obtained by multiplying the figures in the table of standard errors of monthly movements (Table B) by 1.4. A guide to the standard errors of annual movements can be obtained by multiplying the figures in the table of standard errors of estimates (Table A) by 1.4.

TABLE A - STANDARD ERRORS OF ESTIMATES, SOUTH AUSTRALIA

Size of Estimate	Standard Error	Relative Standard Error
2 500	510	20.4
3 000	550	18.3
3 500	590	16.9
4 000	620	15.5
4 500	650	14.4
5 000	680	13.6
6 000	730	12.2
10 000	900	9.0
20 000	1 200	6.0
50 000	1 600	3.2
100 000	2 100	2.1
200 000	2 600	1.3
300 000	2 900	1.0
500 000	3 300	0.7

TABLE B - STANDARD ERRORS OF ESTIMATES OF MONTHLY MOVEMENTS, SOUTH AUSTRALIA

Size of Larger Estimate	Standard Error
2 500	490
3 000	520
3 500	540
4 000	570
4 500	590
5 000	610
6 000	650
10 000	760
20 000	930
50 000	1 200
100 000	1 400
200 000	1 700
300 000	1 900
500 000	2 100

The smaller the estimate the higher is the relative standard error. Very small estimates are subject to such high relative standard errors as to detract seriously from their value for most reasonable uses. Estimates below 2 500, and percentages based on such estimates, have not been included in this publication. Although figures for these small components can in some cases be derived by subtraction, they should not be regarded as reliable.

Examples of the calculations and use of standard errors are given below:

- (i) From Table A it will be seen that the estimate of 328 200 full-time employed males in May 1980 has a standard error of about 3 000, and therefore there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall within the range 325 200 to 331 200 and about nineteen chances in twenty that the value will fall within the range 322 200 to 334 200.
- (ii) The estimate of movement in the number of full-time employed males from April to May 1980 is a decrease of 1 700. Table B relates the standard error of the monthly movement to the larger of the two estimates from which the movement is derived. In this case the April 1980 estimate (329 900) is the larger. From Table B it will be seen that the standard error of the monthly movement is about 1 900. Therefore there are about two chances in three that if all dwellings had been included in the surveys the movement would have been within the range -3 600 to 200 and about nineteen chances in twenty that it would have been within the range -5 500 to 2 100.

It must be remembered that there is no justification for saying that the 'true' estimate is more likely to be at any one point in the range than at any other. Further details on sampling variability can be obtained from the Technical Note in The Labour Force, Australia (Catalogue No. 6203.0).
